

Inherit CustomFields

Usage cases

You want to apply, for a Sub-Task with some of their Custom Field be updated with Parent Custom Field values.

How it works

By defining this Workflow Function in a Transition of your workflow, you are able to force some of Sub-Task's Custom Field to be updated with those of Parent Issue.

Configuring the Feature

To configure the **Inherit CustomFields Post-Function**, please follow these steps :

- Since this Workflow Function does not need to be associated with a screen containing the concerned CustomFields, the function can be added in any Workflow Transition.
It might be:
 - A Common Transition,
 - Or a Global Transition.

If you want to keep these fields synchronized, it will be preferable to removed concerned CustomFields from the Edit Screen of the Sub-Task, and implement then in all transiitons.

Note that if you need to use such Post-Function in a Initial Transition (Create Transition), you have to check that the Post-Function is used :

- After **Create Issue** Post-Function
- and before **index Issue** Post-Function

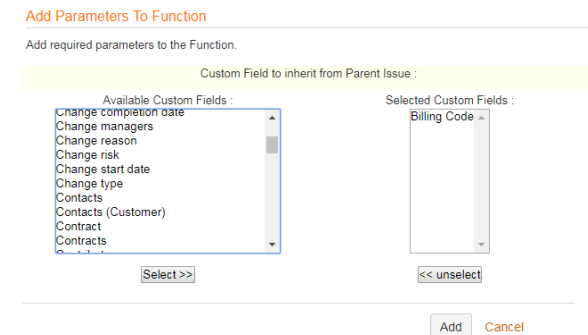

If it is not respected you will experience an error message when trying to perform the transition.

- Add the **Inherit CustomFields Post-Function** to any wanted transition.

For more information on adding a Post Function in Workflow, please see [JIRA: Adding a Post Function](#)

- Its configuration allows you to specify which CustomFields have to be inherited from the Parent Issue.

- You will end up with a transition looking like:

And the XML Declaration as follow :
