Is Issue Editable

On this page:

The default **Edit Issue Operation** is proposed depending on Edit Permission defined in Permission Scheme.

Minyaa provides a new **Edit Issue Operation** a way to extend the Condition to evaluate.

Steps are :

- Default Edit Issue Operation is disabled by APIs
- Evaluation of new condition is delegated to the MinyaaWorkflowManager
  - A new Meta Attribute is evaluated from the Issue's Workflow.

This Meta Attribute may be through a Boolean value :

```
<meta name="jira.issue.editable">false</meta>
```

or a Condition Class (See details.)

```
<meta name="jira.issue.editable">com.company.MyEditableIssueCondition<
/meta>
```

This Meta Attribute may be used :

- At the Workflow Step level

```
<step id="1" name="Open">
        <meta name="jira.status.id">10100</meta>
        <meta name="jira.issue.editable">com.company.
MyEditableIssueCondition</meta>
        <actions>
                <common-action id="10" />
                <common-action id="20" />
        </actions>
</step>
```

- At Edit Action level (See KAAM-190 and KAAM-226), which will be assumed for any Step

```
<global-actions>
        <action id="2" name="Edit Issue"  >
                <meta name="minyaa.jira.operation.id">1</meta>
                <meta name="jira.issue.editable">true</meta>
                <restrict-to> ...        </restrict-to>
                <validators> ... </validators>
                <results> ... </results>
        </action>
</global-actions>
```

Also, you may define a default Edit Condition at Edit Action level, and just add another condition for some of Steps.

Condition defined at Step level will override those defined at Edit Action level.
