

Is Issue Deletable

Delete Issue Operation

The default **Delete Issue Operation** is proposed depending on Delete Permission defined in Permission Scheme.

Minyaa provides a new **Delete Issue Operation** a way to extend the Condition to evaluate.

Steps are :

- Default Delete Issue Operation is disabled by APIs
- Evaluation of new condition is delegated to the MinyaaWorkflowManager
 - A new Meta Attribute is evaluated from the Issue's Workflow.

This Meta Attribute may be through a Boolean value :

```
<meta name="minyaa.jira.issue.deletable">false</meta>
```

or a Condition Class (See [details.](#))

```
<meta name="minyaa.jira.issue.deletable">com.company.  
MyDeletableIssueCondition</meta>
```

This Meta Attribute may be used :

- At the Workflow Step level

```
<step id="1" name="Open">  
  <meta name="jira.status.id">10100</meta>  
  <meta name="minyaa.jira.issue.deletable">com.company.  
  MyDeletableIssueCondition</meta>  
  <actions>  
    <common-action id="10" />  
    <common-action id="20" />  
  </actions>  
</step>
```

- At Edit Action level (See KAAM-190 and KAAM-226), which will be assumed as Global (for any Step)

```
<global-actions>  
  <action id="2" name="Edit Issue" >  
    <meta name="minyaa.jira.operation.id">1</meta>  
    <meta name="minyaa.jira.issue.deletable">true</meta>  
    <restrict-to> ... </restrict-to>  
    <validators> ... </validators>  
    <results> ... </results>  
  </action>  
</global-actions>
```

Also, you may define a default Delete Condition at Edit Action level, and just add another condition for some of Steps.

Condition defined at Step level will override those defined at Edit Action level.
