

Meta-Attributes Management

Overview

Minyaa Workflow Attributes helps you for editing the Workflow Meta-attributes in Step or Transition descriptors.

Meta-attributes are a way to apply some configuration in JIRA. By example, **jira.issue.editable** allows or denies Issue edition.

But in practice, the exercise is no so easy :

- You have to know which attribute are available, using the correct syntax ... (**jira.issue.editable** or **jira.editable.issue**) or spent some (more) time on JIRA documentation of JIRA or in any other useful blog/forum of JIRA Community...
- You have to enter the try correct value, respecting the wanted format

On this page:

- [Overview](#)
- [Goal of Workflow Attributes Management](#)

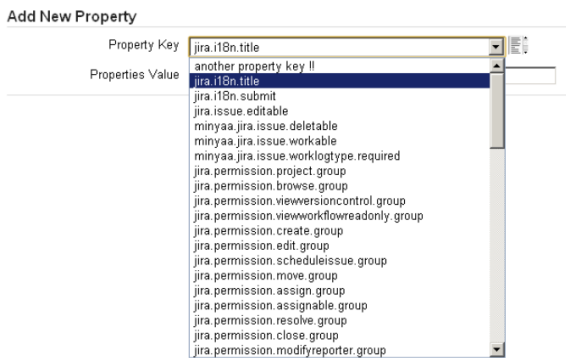

Goal of Workflow Attributes Management

The goal is twice :

- to provide a list of supported Meta-Attributes,
- to provide for edition, a dedicated editor for most of type of supported Meta-Attributes.

A set of supported Meta-Attributes is predefined with the plugin, each with their default editor. **The process as follow for adding a Meta-Attributes is as follow ...**

1. When accessing the Step or Transition Meta-Attributes page, an asynchronous access will modify the default editor and provide a list of available Meta-Attributes.

2. When selecting any Meta-Attributes, the correct editor is displayed. Currently provided editors are :

- String editor (same as default one)
- Boolean editor
- Condition Editor (including Boolean) for some Meta-Attributes provided by Minyaa, related to permissions on issue operations
- User By Step Editor
- Worklog Type Editor

See [Workflow Attributes Editors](#).

3. Select/Edit the value and add it! Less risk to make a typo error in the Meta-Attributes or define your own Meta-Attribute Editor (See [Extending Workflow Attributes Editor](#)).
